# Spaces not distinguishing various kinds of convergence of sequences of real functions

Rafał Filipów

University of Gdańsk

37th International Summer Conference on Real Functions Theory
2023 Rowy, Poland

New results in my talk are from a join work with Adam Kwela:

"*Spaces not distinguishing ideal pointwise and $\sigma$-uniform convergence*"

which is available at arXiv (2308.09557).

# Redefinitions

## Redefinition

- Topological space = nonempty normal (a.k.a. $T_4$) space
- Function = continuous real-valued function defined on $X$ ($f : X \to \mathbb{R}$)

# Four kinds of convergence of sequences of functions

**Pointwise convergence**

$(f_n) \xrightarrow{P} 0$ if $\forall_{\varepsilon>0} \forall_{x\in X} \exists_k \forall_{n>k} (|f_n(x)| < \varepsilon)$

**Equal convergence (1979 – Császár-Laczkovich)**
**Quasi-normal convergence (1991 – Bukovská)**

$(f_n) \xrightarrow{QN} 0$ if $\exists_{(\varepsilon_n)\to 0} \forall_{x\in X} \exists_k \forall_{n>k} (|f_n(x)| < \varepsilon_n)$

**Uniform convergence**

$(f_n) \xrightarrow{U} 0$ if $\forall_{\varepsilon>0} \exists_k \forall_{n>k} \forall_{x\in X} (|f_n(x)| < \varepsilon)$

**$\sigma$-uniform convergence**

$(f_n) \xrightarrow{\sigma-U} 0$ if there is a partition $X_1, X_2, \dots$ of $X$ such that

$$\forall_{k\in\mathbb{N}} \quad (f_n \restriction X_k) \xrightarrow{U} 0$$

# Four kinds of convergence of sequences of functions

**Theorem (Easy)**

$(f_n) \xrightarrow{U} 0 \implies (f_n) \xrightarrow{\sigma-U} 0$ and $(f_n) \xrightarrow{QN} 0 \implies (f_n) \xrightarrow{P} 0$

**Theorem (Császár-Laczkovich, 1979)**

$$(f_n) \xrightarrow{\sigma-U} 0 \iff (f_n) \xrightarrow{QN} 0$$

**Question**

$(f_n) \xrightarrow{U} 0 \overset{?}{\Longleftarrow} (f_n) \xrightarrow{\sigma-U} 0$ and $(f_n) \xrightarrow{QN} 0 \overset{?}{\Longleftarrow} (f_n) \xrightarrow{P} 0$

**Theorem (Easy)**

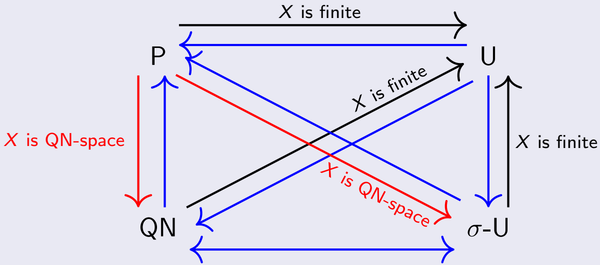
$\forall_{(f_n:X\to\mathbb{R})} \left((f_n) \xrightarrow{U} 0 \Longleftarrow (f_n) \xrightarrow{\sigma-U} 0\right) \iff X$ is finite

**Definition (Bukovský-Recław-Repický, 1991)**

$X$ is a QN-space $\iff \forall_{(f_n:X\to\mathbb{R})} \left((f_n) \xrightarrow{QN} 0 \Longleftarrow (f_n) \xrightarrow{P} 0\right)$

# Four kinds of convergence of sequences of functions

## Diagram of relationships



$(f_n) \xrightarrow{U} 0 \implies (f_n) \xrightarrow{\sigma-U} 0$ , ...

$\forall_{(f_n:X\to\mathbb{R})} \left((f_n) \xrightarrow{U} 0 \impliedby (f_n) \xrightarrow{\sigma-U} 0\right) \iff X$ is finite

$X$ is a QN-spaces $\iff \forall_{(f_n:X\to\mathbb{R})} \left((f_n) \xrightarrow{QN} 0 \impliedby (f_n) \xrightarrow{P} 0\right)$

# Ideals on $\mathbb{N}$

## Definition

A family $\mathcal{I} \subseteq \mathcal{P}(\mathbb{N})$ is an ideal on $\mathbb{N}$ if

1. $A \subseteq B \in \mathcal{I} \implies A \in \mathcal{I}$,
2. $A, B \in \mathcal{I} \implies A \cup B \in \mathcal{I}$,
3. $\mathcal{I}$ contains all finite subsets of $\mathbb{N}$ and $\mathbb{N} \notin \mathcal{I}$.

## Example

1. $\mathrm{Fin} = \{A \subseteq \mathbb{N} : A \text{ is finite}\}$
2. $\mathcal{I}_{1/n} = \left\{A \subseteq \mathbb{N} : \sum_{n \in A} \frac{1}{n} < \infty\right\}$
3. $\mathcal{I}_d = \left\{A \subseteq \mathbb{N} : \lim_{n \to \infty} \frac{|A \cap \{1,\ldots,n\}|}{n} = 0\right\}$

# Ideal convergence of sequences of reals

**Definition**

A sequence $(x_n)$ of reals is convergent to zero if

$$\forall_{\varepsilon>0} \quad \exists_k \ \forall_{n>k} \quad (|x_n| < \varepsilon)$$

equivalently:

$$\forall_{\varepsilon>0} \ \exists_{A\in\mathrm{Fin}} \ \forall_{n\in\mathbb{N}\setminus A} \ (|x_n| < \varepsilon)$$

**Definition**

Let $\mathcal{I}$ be an ideal on $\mathbb{N}$.
A sequence $(x_n)$ of reals is $\mathcal{I}$-convergent to zero if

$$\forall_{\varepsilon>0} \ \exists_{A\in\mathcal{I}} \ \forall_{n\in\mathbb{N}\setminus A} \ (|x_n| < \varepsilon).$$

—

In symbols: $(x_n) \xrightarrow{\mathcal{I}} 0$

**Definition**

A sequence $(x_n)$ of reals is $\mathcal{I}$-convergent to zero ($(x_n) \xrightarrow{\mathcal{I}} 0$) if

$$\forall_{\varepsilon>0} \quad \exists_{A\in\mathcal{I}} \; \forall_{n\in\mathbb{N}\setminus A} \quad (|x_n| < \varepsilon).$$

**Example**

Since $\mathrm{Fin} \subseteq \mathcal{I}$,

$$\text{if } (x_n) \to 0, \text{ then } (x_n) \xrightarrow{\mathcal{I}} 0.$$

**Example**

Let $x_n = \begin{cases} 1 & \text{if } n = 1, 4, 9, \dots, k^2, \dots, \\ 0 & \text{otherwise.} \end{cases}$

Then $(x_n)$ is a divergent sequence, but

$$(x_n) \xrightarrow{\mathcal{I}_{1/n}} 0,$$

because $\sum_{k=1}^{\infty} \frac{1}{k^2} < \infty$, so $A = \{1, 4, 9, \dots, k^2, \dots\} \in \mathcal{I}_{1/n}$.

# Ideal convergence of sequences of functions

Let $\mathcal{I}$ be an ideal on $\mathbb{N}$. Let $f_n : X \to \mathbb{R}$, $n = 1, 2, \ldots$

## Ideal pointwise convergence

$(f_n) \xrightarrow{\mathcal{I}-P} 0$ if $\forall_{\varepsilon>0} \forall_{x\in X} \ \exists_{A\in\mathcal{I}} \forall_{n\in\mathbb{N}\setminus A} \ (|f_n(x)| < \varepsilon)$

## Ideal quasi-normal convergence

$(f_n) \xrightarrow{\mathcal{I}-QN} f$ if $\exists_{(\varepsilon_n)\xrightarrow{\mathcal{I}} 0} \forall_{x\in X} \ \exists_{A\in\mathcal{I}} \forall_{n\in\mathbb{N}\setminus A} \ (|f_n(x)| < \varepsilon_n)$

## Ideal uniform convergence

$(f_n) \xrightarrow{\mathcal{I}-U} 0$ if $\forall_{\varepsilon>0} \ \exists_{A\in\mathcal{I}} \forall_{n\in\mathbb{N}\setminus A} \ \forall_{x\in X}(|f_n(x)| < \varepsilon)$

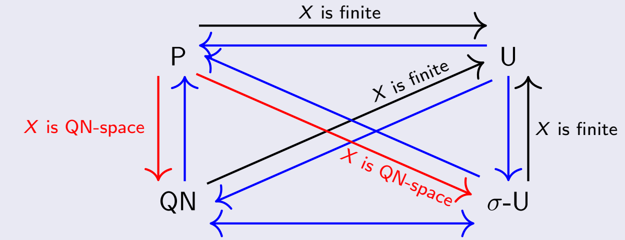
## Ideal $\sigma$-uniform convergence

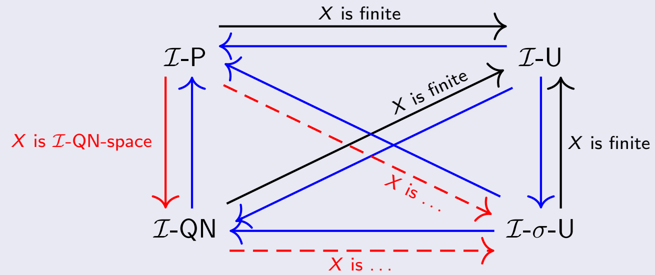
$(f_n) \xrightarrow{\mathcal{I}-\sigma-U} 0$ if there is a partition $X_1, X_2, \ldots$ of $X$ such that

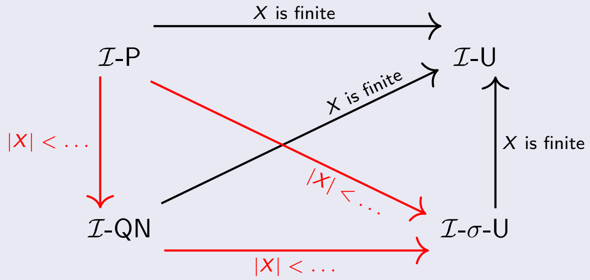
$$\forall_{k\in\mathbb{N}} \quad (f_n \restriction X_k) \xrightarrow{\mathcal{I}-U} 0$$

# Ideal convergence of sequences of functions

## Diagram of relationships





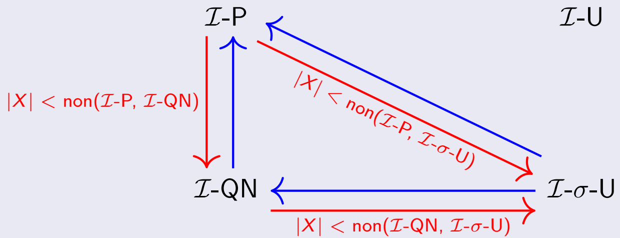


## Definition

- non($\mathcal{I}$-P, $\mathcal{I}$-QN) $= \min\{|X| : \exists_{f_n : X \to \mathbb{R}} \, (f_n \xrightarrow{\mathcal{I}-P} 0 \ \wedge \ f_n \overset{\mathcal{I}-QN}{\not\to} 0)\}$
- non($\mathcal{I}$-QN, $\mathcal{I}$-$\sigma$-U) $= \min\{|X| : \exists_{f_n : X \to \mathbb{R}} \, (f_n \xrightarrow{\mathcal{I}-QN} 0 \wedge f_n \overset{\mathcal{I}-\sigma-U}{\not\to} 0)\}$
- non($\mathcal{I}$-P, $\mathcal{I}$-$\sigma$-U) $= \min\{|X| : \exists_{f_n : X \to \mathbb{R}} \, (f_n \xrightarrow{\mathcal{I}-P} 0 \ \wedge \ f_n \overset{\mathcal{I}-\sigma-U}{\not\to} 0)\}$

# Minimal size of a space which distinguishes convergence

## Relationship



### Theorem (Easy)

$$\text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \min\{\text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-QN}), \ \text{non}(\mathcal{I}\text{-QN}, \mathcal{I}\text{-}\sigma\text{-U})\}$$

### Proof

- If $|X| < \text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U})$, then ..., so $|X| < \min\{\dots, \ \dots\}$
- If $|X| < \min\{\dots, \ \dots\}$, then ..., so $|X| < \text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U})$

# Combinatorial characterizations of non(P, QN)

**Theorem (Bukovský-Recław-Repický, 1991)**

$$\mathrm{non}(\mathrm{P}, \mathrm{QN}) = \mathrm{non}(\mathrm{Fin}\text{-}\mathrm{P}, \mathrm{Fin}\text{-}\mathrm{QN}) = \mathfrak{b},$$

where $\mathfrak{b}$ is the bounding number i.e. the minimal size of an unbounded family of sequences of natural numbers ordered by the relation $\leq^*$ defined by

$$(a_n) \leq^* (b_n) \iff \exists_k \forall_{n>k} (a_n \leq b_n).$$

**Definition**

Let $\mathfrak{b}_\mathcal{I}$ is the minimal size of an unbounded family of sequences of natural numbers ordered by the relation $\leq^\mathcal{I}$ defined by

$$(a_n) \leq^\mathcal{I} (b_n) \iff \exists_{A\in\mathcal{I}} \forall_{n\in\mathbb{N}\setminus A} (a_n \leq b_n).$$

**Remark**

In general,

$$\mathrm{non}(\mathcal{I}\text{-}\mathrm{P}, \mathcal{I}\text{-}\mathrm{QN}) \neq \mathfrak{b}_\mathcal{I}!$$

# Combinatorial characterization of non($\mathcal{I}$-P, $\mathcal{I}$-QN)

## Theorem (F.-Staniszewski, 2015)

$$\text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-QN}) = \mathfrak{b}_S(\mathcal{I}),$$

where

$$\mathfrak{b}_S(\mathcal{I}) = \min\left\{ |\mathcal{E}| : \mathcal{E} \subseteq \mathcal{P}_{\mathcal{I}} \land \forall_{\{A_n\}\in\mathcal{P}_{\mathcal{I}}} \exists_{\{E_n\}\in\mathcal{E}} \bigcup_{n\in\mathbb{N}} (A_{n+1} \cap \bigcup_{i\leq n} E_i) \notin \mathcal{I} \right\}$$

and $\mathcal{P}_{\mathcal{I}}$ is the family of all partitions $\{A_n : n \in \mathbb{N}\}$ of $\mathbb{N}$ such that $A_n \in \mathcal{I}$ for each $n \in \mathbb{N}$.

**Theorem (F.-Kwela, 2023)**

$$\text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathfrak{b}_\sigma(\mathcal{I}),$$

where

$$\mathfrak{b}_\sigma(\mathcal{I}) = \min\{|\mathcal{E}| : \mathcal{E} \subseteq \mathcal{M}_\mathcal{I} \land \forall_{(A_n)\in\mathcal{M}_\mathcal{I}} \exists_{(E_n)\in\mathcal{E}} \forall_k \exists_{n>k} (E_n \not\subseteq A_n)\}$$

and $\mathcal{M}_\mathcal{I}$ is the family of all increasing sequences $(A_n : n \in \mathbb{N})$ such that $A_n \in \mathcal{I}$ for each $n \in \mathbb{N}$.

# Combinatorial characterization of non($\mathcal{I}$-QN, $\mathcal{I}$-$\sigma$-U)

**Theorem (F.-Kwela, 2023)**

$$\mathrm{non}(\mathcal{I}\text{-QN}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathrm{add}_\omega(\mathcal{I}),$$

where

$$\mathrm{add}_\omega(\mathcal{I}) = \min\{|\mathcal{A}| : \mathcal{A} \subseteq \mathcal{I} \land \forall_{(B_n)\in\mathcal{I}^\omega} \exists_{A\in\mathcal{A}} \forall_n (A \not\subseteq B_n))\}$$

and $\mathcal{I}^\omega$ is the family of all sequences $(A_n : n \in \mathbb{N})$ such that $A_n \in \mathcal{I}$ for each $n \in \mathbb{N}$.

**Remark**

- $\mathrm{add}^*(\mathcal{I}) = \min\{|\mathcal{A}| : \mathcal{A} \subseteq \mathcal{I} \land \forall_{B\in\mathcal{I}} \exists_{A\in\mathcal{A}} (A \not\subseteq^* B))\}$
- If $\mathcal{I}$ is a P-ideal, then $\mathrm{add}_\omega(\mathcal{I}) = \mathrm{add}^*(\mathcal{I})$.
- There are non-P-ideals $\mathcal{I}$ with $\mathrm{add}_\omega(\mathcal{I}) \neq \mathrm{add}^*(\mathcal{I}) = \omega$.

# Examples

## Corollary

$$\mathfrak{b}_\sigma(\mathcal{I}) = \min\{\mathfrak{b}_S(\mathcal{I}), \mathrm{add}_\omega(\mathcal{I})\}$$

## Proof

$\mathrm{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \min\{\mathrm{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-QN}),\ \mathrm{non}(\mathcal{I}\text{-QN}, \mathcal{I}\text{-}\sigma\text{-U})\}$

## Examples

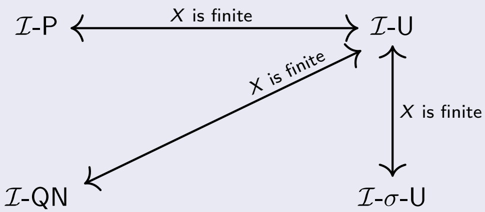
- $\mathfrak{b}_\sigma(\mathrm{Fin}) = \mathfrak{b}_S(\mathrm{Fin}) = \mathfrak{b} < \infty = \mathrm{add}_\omega(\mathrm{Fin})$

- $\mathfrak{b}_\sigma(\mathcal{I}_d) = \mathrm{add}_\omega(\mathcal{I}_d) = \mathrm{add}(\mathcal{N}) \leq \mathfrak{b} = \mathfrak{b}_s(\mathcal{I}_d)$

- $\mathfrak{b}_\sigma(\mathrm{Fin} \otimes \mathrm{Fin}) = \mathfrak{b}_s(\mathrm{Fin} \otimes \mathrm{Fin}) = \mathrm{add}_\omega(\mathrm{Fin} \otimes \mathrm{Fin}) = \mathfrak{b}$
- $\mathfrak{b}_\sigma(\mathcal{I}_{AD}) = \mathfrak{b}_s(\mathcal{I}_{AD}) = \mathrm{add}_\omega(\mathcal{I}_{AD}) = \omega_1$

# Is distinguishing convergence a topological notion?

## Sometimes no!

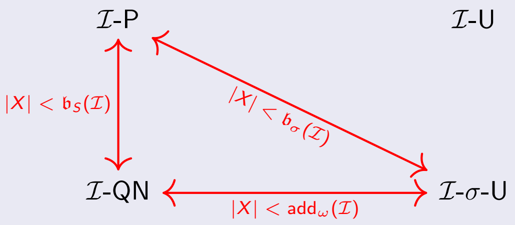


### Theorem

- $\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-U}} 0) \iff |X| < \omega$
- $\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}\text{-QN}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-U}} 0) \iff |X| < \omega$
- $\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-U}} 0) \iff |X| < \omega$

# Is distinguishing convergence a topological notion?

## Sometimes yes!



**Theorem (F.-Kwela, 2023)**

- $|X| < \mathfrak{b}_S(\mathcal{I}) \quad \overset{\Longrightarrow}{\not\Longleftarrow} \quad \forall_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-QN}} 0\right)$
- $|X| < \mathfrak{b}_\sigma(\mathcal{I}) \quad \overset{\Longrightarrow}{\not\Longleftarrow} \quad \forall_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0\right)$
- $|X| < \mathrm{add}_\omega(\mathcal{I}) \quad \overset{\Longrightarrow}{\not\Longleftarrow} \quad \forall_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-QN}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0\right)$

In fact, there exists a Hausdorff compact (hence normal) space $X$ of arbitrary cardinality such that

$$\forall_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0\right)$$

**Theorem (F.-Kwela, 2023)**

There exists a Hausdorff compact (hence normal) space $X$ of arbitrary cardinality such that

$$\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0)$$

**Remark**

The above $X$ is a one-point compactification of a discrete topological space of a given cardinality. This space is not separable (unless it is countable) and all but one points are isolated.

**Theorem (F.-Kwela, 2023)**

There exists a Hausdorff separable, sequentially compact, compact (hence normal) space $X$ of arbitrary cardinality up to $\mathfrak{c}$ such that only countably many points of $X$ are isolated and

$$\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0)$$

## Remark

- Since
$$\mathrm{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathfrak{b}_\sigma(\mathcal{I}),$$
there exists a topological space $X$ such that
$$|X| = \mathfrak{b}_\sigma(\mathcal{I}) \text{ and } \exists_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \not\Leftrightarrow f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0\right)$$
- The space $X$ that is constructed in the proof of the equality
$$\mathrm{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathfrak{b}_\sigma(\mathcal{I})$$
is an uncountable discrete space. In particular, $X$ is not a subspace of reals.
- To obtain $X$ as a subset of reals we need one more characterization of $\mathrm{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U})$

### Definition

- The set $\mathcal{D}_\mathcal{I} \subseteq \mathbb{N}^\mathbb{N}$ is defined by

$$x \in \mathcal{D}_\mathcal{I} \iff x^{-1}[\{n\}] \in \mathcal{I} \text{ for every } n \in \mathbb{N}$$

- The binary relation $\preceq_\mathcal{I}$ on $\mathcal{D}_\mathcal{I}$ is defined by

$$x \preceq_\mathcal{I} y \iff \{m \in \omega : \exists k \in \omega\, (x(k) \leq m < y(k))\} \quad \text{is finite}$$

- The bounding number of the relation $\preceq$:

$$\mathfrak{b}(\preceq_\mathcal{I}) = \min\{|B| : B \text{ is } \preceq_\mathcal{I}\text{-unbounded}\}$$
$$= \min\{|B| : \forall_{x \in \mathcal{D}_\mathcal{I}} \exists_{y \in B}\ (y \not\preceq_\mathcal{I} x)\}$$

### Theorem (F.-Kwela, 2023)

$$\text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathfrak{b}(\preceq)$$

**Corollary**

$$\mathfrak{b}_\sigma(\mathcal{I}) = \text{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathfrak{b}(\preceq_{\mathcal{I}})$$

**Theorem (F.-Kwela, 2023)**

If $X \subseteq \mathbb{N}^{\mathbb{N}}$ is $\preceq_{\mathcal{I}}$-unbounded, then

$$\exists_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \;\not\Leftrightarrow\; f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0\right)$$

**Corollary**

There exists a subset $X$ of reals such that $|X| = \mathfrak{b}_\sigma(\mathcal{I})$ and

$$\exists_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \;\not\Leftrightarrow\; f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0\right)$$

# Distinguishing spaces not distinguishing convergence

**Corollary**

It is consistent that there exists $X$ such that

- $\forall_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\text{Fin-P}} 0 \iff f_n \xrightarrow{\text{Fin-}\sigma\text{-U}} 0\right)$
- $\exists_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}_d\text{-P}} 0 \not\Leftrightarrow f_n \xrightarrow{\mathcal{I}_d\text{-}\sigma\text{-U}} 0\right)$

**Proof**

- $\text{non}(\mathcal{I}_d\text{-P}, \mathcal{I}_d\text{-}\sigma\text{-U}) = \mathfrak{b}_\sigma(\mathcal{I}_d) = \text{add}(\mathcal{N}) \leq \mathfrak{b} = \mathfrak{b}_\sigma(\text{Fin}) = \text{non}(\text{P},\sigma\text{-U})$
- Consistently: $\text{add}(\mathcal{N}) < \mathfrak{b}$
- Taking $X$ such that $|X| = \text{add}(\mathcal{N})$ and

$$\exists_{(f_n : X \to \mathbb{R})} \left(f_n \xrightarrow{\mathcal{I}_d\text{-P}} 0 \not\Leftrightarrow f_n \xrightarrow{\mathcal{I}_d\text{-}\sigma\text{-U}} 0\right),$$

we are done.

## Corollary

It is consistent that there exists $X$ such that

- $\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathrm{Fin}\text{-P}} 0 \iff f_n \xrightarrow{\mathrm{Fin}\text{-}\sigma\text{-U}} 0)$
- $\exists_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}_d\text{-P}} 0 \not\Longleftrightarrow f_n \xrightarrow{\mathcal{I}_d\text{-}\sigma\text{-U}} 0)$

## Question

Do there exist a space $X$ and an ideal $\mathcal{I}$ such that

- $\exists_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathrm{Fin}\text{-P}} 0 \not\Longleftrightarrow f_n \xrightarrow{\mathrm{Fin}\text{-}\sigma\text{-U}} 0)$
- $\forall_{(f_n:X\to\mathbb{R})}\ (f_n \xrightarrow{\mathcal{I}\text{-P}} 0 \iff f_n \xrightarrow{\mathcal{I}\text{-}\sigma\text{-U}} 0)$

## Remark

- For every ideal $\mathcal{I}$,

$$\mathrm{non}(\mathcal{I}\text{-P}, \mathcal{I}\text{-}\sigma\text{-U}) = \mathfrak{b}_\sigma(\mathcal{I}) \leq \mathfrak{b} = \mathfrak{b}_\sigma(\mathrm{Fin}) = \mathrm{non}(\mathrm{P}, \sigma\text{-U})$$

- Hence, the cardinality argument does not work in this case.
