# Introduction

One aspect of the equivalence between large cardinal hypotheses and determinacy hypotheses is captured by:

**Problem:** Analyze HOD in models of determinacy.

Post-1970 work on it has been done by Becker, Harrington, Kechris, Martin, Moschovakis, Sargsyan, Solovay, Steel, Woodin, and others.

Main methods: descriptive set theory (games and definable scales) and inner model theory (mice and iteration strategies).

Introduction

Comparison of mouse pairs

Hod pair capturing and HOD.

Mouse pairs and Suslin cardinals

*Conjecture 1.* Assume  $AD^+ + V = L(P(\mathbb{R}))$ ; then  $HOD \models GCH$ .

*Conjecture 2.* There is  $M \models AD^+ + V = L(P(\mathbb{R}))$  such that  $HOD^M \models$  “there is a huge cardinal”.

## Introduction

Preliminaries

Mouse pairs

Comparison of mouse pairs

Hod pair capturing and HOD.

Mouse pairs and Suslin cardinals

*Conjecture 1.* Assume  $AD^+ + V = L(P(\mathbb{R}))$ ; then  $HOD \models GCH$ .

*Conjecture 2.* There is  $M \models AD^+ + V = L(P(\mathbb{R}))$  such that  $HOD^M \models$  “there is a huge cardinal”.

Recent (2015-present) progress on these conjectures has come from isolating the notion of *mouse pair*, and proving a general comparison theorem for them. *Modulo the existence of iteration strategies*, mouse pairs can be used to analyze HOD.

# A Glossary

- (a) An *extender*  $E$  over  $M$  is a system of measures on  $M$  coding an elementary  $i_E: M \rightarrow \text{Ult}(M, E)$ .  $E$  is *short* iff all its component measures concentrate on  $\text{crit}(i_E)$ .

## Definition

A *mouse pair* is a pair  $(P, \Sigma)$  such that

- (1)  $P$  is a countable premouse (pure extender or least branch),
- (2)  $\Sigma$  is an iteration strategy defined on all countable stacks on  $P$ ,
- (3)  $\Sigma$  normalizes well and has strong hull condensation, and
- (4) if  $P$  is an lpm, then whenever  $Q$  is a  $\Sigma$ -iterate of  $P$  via  $s$ , then  $\dot{\Sigma}^Q \subseteq \Sigma_s$ .

# Strong hull condensation

Roughly,  $\Sigma$  has *strong hull condensation* iff  $\mathcal{T}$  and  $\mathcal{U}$  are normal trees on  $P$ , and  $\mathcal{U}$  is by  $\Sigma$ , and  $\Phi: \mathcal{T} \rightarrow \mathcal{U}$  is appropriately elementary, then  $\mathcal{T}$  is by  $\Sigma$ .

Introduction

Mouse pairs and  
Suslin cardinals

# Strong hull condensation

Roughly,  $\Sigma$  has *strong hull condensation* iff  $\mathcal{T}$  and  $\mathcal{U}$  are normal trees on  $P$ , and  $\mathcal{U}$  is by  $\Sigma$ , and  $\Phi: \mathcal{T} \rightarrow \mathcal{U}$  is appropriately elementary, then  $\mathcal{T}$  is by  $\Sigma$ .

One must be careful about the elementarity required of  $\Phi$ , and in particular, the extent to which  $\Phi$  is required to preserve ext extenders. There are several possible condensation properties here: hull condensation (Sargsyan), strong hull condensation, and still stronger ones.

Introduction

Preliminaries

**Mouse pairs**

Comparison of mouse pairs

Hod pair capturing and HOD.

Mouse pairs and Suslin cardinals

## Normalizing well

For  $\langle \mathcal{T}, \mathcal{U} \rangle$  a stack on  $P$ , there is a natural normal tree  $\mathcal{W} = W(\mathcal{T}, \mathcal{U})$  obtained by inserting the extenders of  $\mathcal{U}$  into  $\mathcal{T}$ . We have

Then  $\Sigma$  2-normalizes well iff

$\langle \mathcal{T}, \mathcal{U} \rangle$  is by  $\Sigma$  iff  $W(\mathcal{T}, \mathcal{U})$  is by  $\Sigma$ ,

and

$$\Sigma_{\langle \mathcal{W} \rangle}^{\pi} = \Sigma_{\langle \mathcal{T}, \mathcal{U} \rangle}.$$

for all such stacks  $\langle \mathcal{T}, \mathcal{U} \rangle$ .

Introduction

Preliminaries

**Mouse pairs**

Comparison of  
mouse pairs

Hod pair  
capturing and  
HOD.

Mouse pairs and  
Suslin cardinals

One can extend the construction of  $W(\mathcal{T}, \mathcal{U})$  so as to define the embedding normalization  $W(s)$  of a countable stack of normal trees. One has an elementary  $\pi$  from the last model of  $s$  to the last model of  $W(s)$ . If one has

$$s \text{ is by } \Sigma \text{ iff } W(s) \text{ is by } \Sigma,$$

and

$$\Sigma_{\langle W(s) \rangle}^{\pi} = \Sigma_s.$$

for all such stacks  $\langle \mathcal{T}, \mathcal{U} \rangle$ , and the same is true for all tails of  $\Sigma$ , then we say that  $\Sigma$  *normalizes well*.

## Theorem

*(Schlutzenberg 2015) Let  $\Sigma$  be a strategy defined on normal trees, and have strong hull condensation; then  $\Sigma$  has a unique extension  $\Psi$  to stacks of normal trees such that  $\Psi$  has strong hull condensation and normalizes well.*

# Elementary properties of mouse pairs

## Definition

$\pi: (P, \Sigma) \rightarrow (Q, \Psi)$  is *elementary* iff  $\pi: P \rightarrow Q$  is  $\Sigma_k$  elementary, where  $k = k(P)$ , and  $\Sigma = \Psi^\pi$ .

## Lemma

*An elementary submodel of a mouse pair is a mouse pair.*

The construction of Suslin representations for the iteration strategies in mouse pairs plays an important role in many of the proofs above.

# Suslin representations for mouse pairs

Let  $(P, \Sigma)$  be a mouse pair. A tree  $\mathcal{T}$  by  $\Sigma$  is  $M_\infty$ -relevant iff there is a normal  $\mathcal{U}$  by  $\Sigma$  extending  $\mathcal{T}$  with last model  $Q$  such that the branch  $P$ -to- $Q$  does not drop.  $\Sigma^{rel}$  is the restriction of  $\Sigma$  to  $M_\infty$ -relevant trees.

Recall that  $A$  is  $\kappa$ -Suslin iff  $A = p[T]$  for some tree  $T$  on  $\omega \times \kappa$ .

## Theorem

$(AD^+)$  Let  $(P, \Sigma)$  be an lbr hod pair with scope HC; then  $Code(\Sigma^{rel})$  is  $\kappa$ -Suslin, for  $\kappa = |M_\infty(P, \Sigma)|$ .

Suslin cardinals

*Proof sketch.*  $M_\infty(P, \Sigma)$  is the direct limit along a generic stack  $s$  of trees by  $\Sigma$ . But  $s$  can be fully normalized, so there is a single normal tree  $\mathcal{W}$  on  $P$  with last model  $M_\infty(P, \Sigma)$  such that every countable “weak hull” of  $\mathcal{W}$  is by  $\Sigma$ . But then for  $\mathcal{T}$  countable and  $M_\infty$ -relevant,

$$\mathcal{T} \text{ is by } \Sigma \Leftrightarrow \mathcal{T} \text{ is a weak hull of } \mathcal{W}.$$

The right-to-left direction follows from very strong hull condensation for  $\Sigma$ .

For left-to-right direction, we may assume  $\mathcal{T}$  has last model  $Q$ , and  $P$ -to- $Q$  does not drop. We then have a normal  $\mathcal{U}$  on  $Q$  with last model  $M_\infty(P, \Sigma)$  such that all countable weak hulls of  $\mathcal{U}$  are by  $\Sigma$ .

HOD.

Mouse pairs and  
Suslin cardinals

We have

Then

$$\mathcal{W} = X(\mathcal{T}, \mathcal{U})$$

is the full normalization of  $\langle \mathcal{T}, \mathcal{U} \rangle$ . The construction of  $X(\mathcal{T}, \mathcal{U})$  produces a weak hull embedding from  $\mathcal{T}$  into  $X(\mathcal{T}, \mathcal{U})$ , which is what we want.

Mouse pairs and  
Suslin cardinals

We have

Then

$$\mathcal{W} = X(\mathcal{T}, \mathcal{U})$$

is the full normalization of  $\langle \mathcal{T}, \mathcal{U} \rangle$ . The construction of  $X(\mathcal{T}, \mathcal{U})$  produces a weak hull embedding from  $\mathcal{T}$  into  $X(\mathcal{T}, \mathcal{U})$ , which is what we want.

Thus our Suslin representation verifies that  $\mathcal{T}$  is in the  $M_\infty$ -relevant part of  $\Sigma$  by producing a weak hull embedding of  $\mathcal{T}$  into  $\mathcal{W}$ .
